

Blood Pressure Management Control

*This measure is to be reported for all patients aged 18 years and older with Ischemic Vascular Disease — a minimum of **once** per reporting period*

Measure description

Percentage of patients aged 18 years and older with Ischemic Vascular Disease who had most recent blood pressure in control (less than 140/90 mmHg)

What will you need to report for each patient with Ischemic Vascular Disease for this measure¹?

- The most recent systolic blood pressure measurement
 - Systolic blood pressure < 140 mmHg OR
 - Systolic blood pressure ≥ 140 mmHg

AND

- The most recent diastolic blood pressure measurement
 - Diastolic blood pressure < 90 mmHg OR
 - Diastolic blood pressure ≥ 90 mmHg

What if this process or outcome of care is not appropriate for your patient?

Some measures provide an opportunity for the physician or eligible health professional to document when a process or outcome of care is not appropriate for a given patient (also called performance exclusions). Because this measure is applicable to most if not all patients, there are no allowable performance exclusions.

¹To describe both systolic and diastolic blood pressure values, each must be reported separately. If there are multiple blood pressures on the same date of service, use the lowest systolic and lowest diastolic blood pressure on that date as the representative blood pressure.
